

Introducing Veritas InfoScale for Kubernetes

Delivering enterprise resiliency, mobility, and efficiency for Kubernetes mission-critical environments.

Background

The global adoption of containers as a platform to improve IT service management and delivery has accelerated. Gartner predicts that 90% of global organizations will be running containerized applications in production by 2026. The Kubernetes container orchestration platform delivers game-changing business benefits that companies can no longer ignore. For example, Kubernetes facilitates faster time to market for new application features and services, as well as improved product and service quality with faster software updates and patches. Most importantly, it enables organizations to avoid vendor lock-in because containerizing workloads improves their portability. All these benefits provide a competitive edge for those companies that are the first to successfully adopt and manage this new application compute platform.

Like all emerging technology, it will take time and engineering experience to develop and integrate advanced availability features for Kubernetes that allow organizations to achieve the same service level agreement (SLA) levels that they have with their current environment. Organizations are looking for solutions that can enable them to meet their SLAs for their mission-critical applications, so they can extract maximum value from their Kubernetes deployments. Veritas InfoScale™ provides this parity, filling capability gaps in Kubernetes to support stateful containerized applications with enterprise-class availability and recoverability.

Introducing Veritas InfoScale for Kubernetes

Based on years of experience supporting mission-critical environments and expertise gained working with these new compute platforms, Veritas InfoScale for Kubernetes was created. The solution is specifically designed to advance the maturity of the container market, providing increased resiliency, mobility, and efficiency needed to support mission-critical applications in Kubernetes deployments. Veritas combines the portability of containers with the data services abstraction of InfoScale to help enterprises achieve their digital transformation and application modernization goals.

Advanced Data Services for Stateful Applications

Veritas InfoScale for Kubernetes empowers enterprise customers and DevOps engineers to deploy enterprise-class data services with resiliency, mobility, and efficiency, using containerized applications on both native Kubernetes and Red Hat OpenShift™ deployments.

Key Functionality

- **Resiliency** – Being IT resilient means being prepared for any type of disruption, planned or unplanned, to mitigate the risk of downtime or service disruption. InfoScale provides:

- o Automated or manual disaster recovery to protect against site failures. This includes multiple disaster recovery (DR) plans to simplify the setup and failover of persistent storage volumes, namespace, and cluster metadata to a remote hybrid-cloud site to continue application accessibility
- o Faster failover of faulty nodes within the cluster protects against potential data corruption and allows stateful application operations to resume in seconds

- **Mobility** – IT mobility is the ability to move information and services freely and easily to meet the needs of the business. InfoScale enables organizations to:

- o Replicate persistent storage volumes from test/dev clusters to production clusters with minimal disruption
- o Migrate persistent storage volumes across hybrid cloud environments to avoid vendor lock-in
- o Create persistent storage volumes snapshots for backup and recovery of mission-critical applications

- **Efficiency** – IT efficiency is about “doing more with less” by maintaining or improving the quality of IT services delivered to the organization, while reducing costs. InfoScale delivers:

- o A software-defined storage layer that enables IT to leverage existing server and SAN storage to create enterprise-class persistent storage volumes, while decreasing the need for additional capital expense
- o The ability to create persistent storage volume classes for high-performance, increased resilience, and secure encryption enables organizations to meet the different requirements of their applications
