Cyber criminals are trying to take down your backup and data protection infrastructure by inserting malware into your network months before they trigger a catastrophic cyber event. Hackers watch your data at all points of activity to find vulnerable spots to exfiltrate or steal your data. Cyber risks are not just ransomware, but also include hackers stealing your data and holding it hostage with the threat of public-facing ruin. With Veritas Security Meter, you can monitor and mitigate malicious activity.

Encryption is a key part of your cloud security strategy. By inserting malware into your network, they create a backdoor to breach your data. hacker must break through and increase your visibility to quickly identify and isolate security events. Encryption supports the security strategy by allowing you to have a zero trust approach and construct comprehensive protection against cyber threats so you can be confident that you stay protected no matter where your data resides.
