Executive Summary

A growing number of organizations are migrating their business-critical IT applications and services to the public cloud. Nowhere is this more evident than with SAP S/4HANA, which represents nearly 25% of the global market share for Enterprise Resource Planning (ERP) applications. With public cloud providers largely operating on a shared responsibility model, there is an ongoing need to ensure that your business-critical SAP applications have a proven enterprise solution to ensure uptime and resiliency.

Veritas Alta Enterprise Resiliency is a cloud-focused solution designed to keep your SAP business-critical applications highly available in Azure. With functionality designed specifically to ensure availability and resiliency for SAP S/4HANA and Azure cloud infrastructure, Veritas Alta Enterprise Resiliency provides several key benefits:

- **Availability**—ensure maximum uptime for your SAP S/4HANA business applications in the cloud
- **Resiliency**—automated disaster recovery minimizes application downtime and simplifies management
- **Optimization**—automate manual processes and minimize both downtime and operational costs

As an SAP certified solution, Veritas Alta Enterprise Resiliency has a proven track record of delivering high availability and resiliency for business-critical SAP applications for the world's largest organizations. When deploying SAP S/4HANA in Azure, Veritas Alta Enterprise Resiliency has been designed to ensure both your SAP applications and your cloud infrastructure is highly available and providing a smooth and predictable experience for end users.

Document Focus

This document will provide guidance on how to implement a highly available SAP S/4HANA environment in the Azure public cloud using Veritas Alta Enterprise Resiliency. It is intended for the following audiences:

Organizations who deploy SAP systems on Azure for development, testing, training, sandboxing, demonstration, or production purposes and want to monitor and manage SAP NetWeaver (S/4HANA) and SAP HANA for high availability and disaster recovery

SAP Basis and SAP implementation consultants who are familiar with Azure and want to manage the availability of SAP systems running in Azure using Veritas Alta Enterprise Resiliency

This document does not replace any standard SAP or Azure documentation. For information on basic SAP high availability configurations on Azure, refer to the Azure documentation at:

- awsstatic.com/enterprise-marketing/SAP/sap-on-aws-high-availability-guide.pdf
- azurestatic.com/enterprise-marketing/SAP/sap-on-Azure-high-availability-guide.pdf

When implementing SAP solutions on Azure, refer to the standard SAP documentation and notes for the respective SAP solution:

- scn.sap.com/community/linux
- service.sap.com/instguides
- sdn.sap.com/irj/sdn/index
- service.sap.com/notes

For more information about SAP on Azure, refer to the Microsoft Azure documentation at:

- docs.microsoft.com/en-us/azure/virtual-machines/workloads/sap/sap-hana-availability-overview
Veritas Alta Enterprise Resiliency

With advanced volume management, file system and application clustering technology, Veritas Alta Enterprise Resiliency is responsible for protecting the world’s business-critical applications and databases across several industry verticals. It enables you to rapidly deploy highly available, performant, multi-tier services using nearly any operating system, underlying storage, compute infrastructure or cloud platform. Veritas Alta Enterprise Resiliency also includes extensive integration with S/4HANA and SAP HANA, with an emphasis on automation, data integrity, scalability and minimizing downtime.

Veritas Alta Enterprise Resiliency offers full support for the Azure public cloud and includes an intuitive configuration model that provides a granular, application-centric view of your critical services. Azure by design addresses the potential for infrastructure outages when applications are installed in multiple Availability Zones (AZ’s). However, the cloud shared responsibility model implies that infrastructure high availability alone does not address the requirement to configure your SAP application environment for high availability—this requires an independent clustering solution. Veritas Alta Enterprise Resiliency delivers native support for all SAP S/4HANA components with the additional benefit of improved resiliency in the Azure cloud infrastructure services.

Veritas Alta Enterprise Resiliency is easily deployed and managed inside Azure VM’s, thereby offering operational parity with similar configurations on-premises. Azure cloud infrastructure does not directly integrate with the embedded resiliency features from SAP, hence the need for Veritas Alta Enterprise Resiliency which can automate high availability, resiliency and recovery procedures.

Veritas Alta Enterprise Resiliency for SAP

The following SAP components need to be made highly available—any associated single points of failure need to be eliminated:

- SAP HANA Database
- Central Services instance (ENQUEUE)
- Enqueue replication server (ERS)
- Primary application server (PAS)
- Additional application servers (AAS)

The SAP HANA database and SAP central services are installed on one instance at a time. This creates a single point of failure. Since multiple SAP application server (dialog) instances can run in parallel, they are inherently immune from most single points of failure. However, when an application deployed in the same AZ or across AZs fails, Azure restarts the application compute instances or redeploys the EC2 instance where the application has failed. This impacts the overall Recovery Time Objective (RTO).

Veritas Alta Enterprise Resiliency ensures the proper failover of all SAP components to a designated or alternate EC2 instance on which the application can reside. This effectively manages your overall recovery time and can also manage your Recovery Point Objective (RPO) when combined with the Flexible Storage Sharing (FSS) feature.

Organizations often resort to OS-specific or customized scripts to monitor their critical applications. Veritas Alta Enterprise Resiliency supports the largest catalog of pre-built enterprise agents that simplify such deployments, thereby eliminating the need for custom monitoring tools. With intelligent failover capabilities, organizations can reduce the cost of redeploying instances by reducing the number of standby or passive servers within Azure.

Configuring high availability (HA) and disaster recovery (DR) with Veritas Alta Enterprise Resiliency for business-critical SAP workloads is relatively simple and quick. As an additional benefit, non-disruptive recovery validation across Azure regions can be done using the integrated FireDrill DR testing feature.

Table 1 shows the Veritas Alta Enterprise Resiliency agents for each of the application and infrastructure components that need to be managed as part of an overall HADR solution for SAP S/4HANA in Azure.

Types of Veritas Alta Enterprise Resiliency configurations

The following graphic depicts various availability and recovery configurations created using Veritas Alta Enterprise Resiliency:

Veritas Alta Enterprise Resiliency Capabilities for SAP Ecosystems

The following HA and DR capabilities of Veritas Alta Enterprise Resiliency makes it ideal for managing an SAP ecosystem in Azure:

- Business continuity with minimal application downtime during failures through complete automation for the SAP landscape
- Optimal server utilization due to cost-effective failover configurations for development, testing, or production environments
- Support for cost optimization, Recovery Point Objective (RPO), and Recovery Time Objective (RTO) requirements for SAP workloads in Microsoft Azure
- Failover between on-premises data centers and Microsoft Azure
- Failover between Microsoft Azure availability zones (AZ)
- Failover between Microsoft Azure regions
• Failover between Azure and other cloud service providers
• SAP agents that provide:
  • A similar customer experience both on-premises and in Microsoft Azure
  • Flexible Storage Sharing (FSS) for data sharing in Microsoft Azure across instances
  • Replication across Microsoft Azure AZs and regions using Veritas Volume Replicator

About Veritas Virtual Business Services (VBS)

IT services are no longer standalone applications running on single servers. Business services or multi-tier applications like SAP Business Suite applications make up most of an IT organization's critical workloads, with different components of the application running on different tiers of infrastructure, each with their own unique availability requirements. A failure in any tier can bring down the entire business service and managing the recovery is time consuming and complex. Virtual Business Services are aware of the complete business service and takes the appropriate action in the event of a failure to restore the entire service. When an individual component fails, Virtual Business Service provides automated orchestration of the connections to other computing resources, within an availability zone, across availability zones or even across regions. This means faster recovery and minimal downtime—with no manual intervention.

Flexible Storage Sharing

Veritas Alta Enterprise Resiliency's FSS feature combines a distributed, high-performance, and highly available file system with the latest cloud storage and networking technologies. FSS lets you unlock the potential of Direct Attached Azure managed disks, without sacrificing performance or availability. With FSS, you can use Microsoft Azure block storage services to create a highly available shared storage cluster in the cloud that provides high performance and resiliency for your critical applications.

**Note:** FSS supports all Azure storage volumes and can be used for SAP NetWeaver / S/4HANA Application server instance mounts like sapmnt, trans, SAP Central Service instance (ENQUEUE) and Enqueue Replication instance (ERS) mounts for fast failover over and high availability. FSS is not yet certified by SAP for the SAP HANA DB.

For details, see the Veritas FSS datasheet at: [veritas.com/content/dam/www/en_us/documents/data-sheet/DS_alta_shared_storage_V1801.pdf](veritas.com/content/dam/www/en_us/documents/data-sheet/DS_alta_shared_storage_V1801.pdf)
Replication in Veritas Alta Enterprise Resiliency

Veritas Alta Enterprise Resiliency includes Veritas Volume Replicator (VVR) which is a software-based data replication solution designed to contribute to an effective disaster recovery plan. VVR enables you to maintain a consistent copy of application data at one or more availability zones or regions.

VVR benefits from the robustness, ease of use, and high performance of Veritas Volume Manager (VxVM), and at the same time, adds replication capability to VxVM. It can replicate existing VxVM configurations, and can be transparently configured while the application is active.

VVR replicates the application writes on the volumes at the source AZ to one or more alternate AZ or region. It provides a consistent copy of application data at the remote locations. If a disaster occurs at the source location, you can use that copy to simply restart the application at the alternate AZ or region.

The system on which the application is running at the source location is called the Primary system, and the system at the target location is called the Secondary system.

The volumes on the Primary system must be initially synchronized with the volumes on the Secondary system. VVR lets you initialize the application data between the primary location and the secondary location using your IP network.

Considerations for Using FSS or VVR across Availability Zones

It’s important to take the following considerations into account when using FSS or VVR across AZs:

- FSS can be used in active-active applications where the application can access the data on both AZs simultaneously. VVR cannot be used for active-active applications.
- When either FSS or VVR synchronous replication is used, the application throughput depends on the network characteristics, because the data needs to be mirrored or synchronized to the other AZ.
- For applications that can sustain some increase in RPO but need high throughput, Veritas recommends using VVR asynchronous replication.
- FSS can be used in Azure to provide a shared storage environment to the applications running on multiple nodes in a cluster.
- VVR can be used for replication across regions in Azure.

High Availability SAP Agents

Veritas Alta Enterprise Resiliency provides a number of SAP specific high availability agents which can be found here: https://sort.veritas.com/agents.

Veritas Cluster Server Agent for SAP NetWeaver / S/4HANA

The Veritas SAPNW agent is a certified Cluster Server agent from the SAP ICC program. The Cluster Server agent for SAP NetWeaver / S/4HANA (SAPNW) provides high availability for SAP NetWeaver / S/4HANA instances. The agent can monitor and manage the status (online/offline) of an NetWeaver / S/4HANA instance. It also monitors the system processes and the server state and shuts down the instance in case of a failover.

The SAPNW agent supports the following NetWeaver / S/4HANA features:

- Fast Failover of faulted Instances within an AZ
- Applications instance failover in case of an AZ failover
- Auto-restart of an SAP NetWeaver / S/4HANA instance before takeover
- In-depth monitoring and Intelligent Monitoring Framework (IMF) support
- Support for in-depth TRACE and Debug Log levels for troubleshooting
Veritas Alta Enterprise Resiliency integration with SAP library and the Veritas connector script

The SAP NetWeaver agent enables the integration of Veritas Alta Enterprise Resiliency with SAP NetWeaver (7.x or later) and SAP Kernel (7.20 x or later) DCK. For this purpose, it uses an SAP-provided library (saphascriptco.so) and a Veritas provided cluster connector script (sap_symc_cluster_connector). This integration enables the SAP sapstartsrv component to communicate SAP instance status changes that are made by SAP clients to Veritas Alta Enterprise Resiliency.

In a typical Veritas Alta Enterprise Resiliency cluster, when an SAP administrator changes the status of an SAP instance using an SAP client, such as sapcontrol or startsap, the following events occur:

- When the administrator stops the SAP instance, Veritas Alta Enterprise Resiliency detects a fault and performs the clean operation
- When the administrator starts the SAP instance, Veritas Alta Enterprise Resiliency detects that the instance is brought online outside of its control

You must enable communication between sapstartsrv and Veritas Alta Enterprise Resiliency. Doing so ensures that sapstartsrv can inform when an SAP client is used to start or stop an assigned SAP instance. Veritas Alta Enterprise Resiliency can then detect the correct status of the SAP instance.

Standalone Enqueue Server 2 (ENSA2) Support:

Under high availability it is mandatory that the old mechanism of Standalone Enqueue Server (ENSA1) has to fail over to the cluster node where the active ERS is running to acquire the replicated enqueue table which resides in the shared memory of the active ERS node.

The new Standalone Enqueue Server 2 and Enqueue Replicator 2 provides an improved high availability architecture with robust, fast replication and failover.

In ENSA2, if the ASCS fails it can start on a separate node in the cluster and copy the lock entries from the enqueue replicator 2. It is not mandatory that it fails over to the active ERS2 node.

The Veritas SAPNW agent supports both of the Enqueue replication methods and is certified by SAP.

Veritas agent for SAP HANA

The Cluster Server agents monitors specific resources within an enterprise application. They determine the status of resources and start or stop them based on external events that may affect application availability.

The Cluster Server agent for SAP HANA (SAPHDB) provides high availability for HANA instances where the data is replicated with HANA System Replication. The agent brings a HANA instance online, monitors the instance, and takes the instance offline. It also monitors the system processes and the server state and shuts down the server in case of a failover.

Veritas agent for Microsoft Azure IP

Veritas provides the AZUREIP agent, which lets you monitor and manage the following networking resources in Azure:

- Private IP: A private IP is a private numerical address that networked devices use to communicate with one another
- Azure IP: An Azure IP address is a static IPv4 address designed for dynamic cloud computing, and is associated with your Microsoft Azure account
- Overlay IP: Microsoft Azure allows you to redirect IP address traffic to an Azure instance in a Virtual Private Network (VPC) regardless of the subnet or AZ to which it belongs. An overlay IP lets you fail over IP addresses between cluster nodes when they are spread across multiple subnets or AZs

Veritas also supports the Azure load balancer which enables the movement of virtual IPs between the clustered hosts as an alternative.
Veritas agent for Microsoft AzureDNS

Azure DNS is a highly available and scalable cloud Domain Name System (DNS) web service. Veritas provides the AzureDNSZone agent to update and monitor the mapping between host names and IP addresses. The agent manages the mapping for the Azure route domain when failing over nodes across subnets. When you create a hosted zone, AzureDNSZone automatically creates a name server (NS) record and a start of authority (SOA) record for the zone.

If the resource records need to be dynamically added and deleted from the Azure route domain during failover, you must use the AzureDNSZone agent. The agent updates the NS with the new resource record mappings during failover and allows the clients to connect to the failed over instance of the application.

**Note:** If you do not want to use the AzureDNSZone agent, you can continue to use the Veritas DNS agent for managing DNS records.

Typical NetWeaver /S/4HANA Deployment Architecture Configuration Across Availability Zones in Azure

The following two graphics describe the overall deployment of an SAP NetWeaver / S/4HANA application server with an SAP supported database and with SAP HANA in Azure across Availability Zones.

![Figure 3. SAP NetWeaver with Non-HANA Databases](image-url)
**Note:** FSS supports all Azure storage services. VxVM, VxFS, and FSS can be used with S/4HANA / SAP NetWeaver application servers as well as most database management systems, however these features are not currently supported for use with SAP HANA databases.

Both solution architectures illustrate the recommended approach to achieving high availability for SAP NetWeaver / S/4HANA with SAP recommended databases in Azure using Veritas Alta Enterprise Resiliency. High availability for your front-end and middle tier can be obtained by using Azure Load Balancers or Application Gateways. This ensures the uptime SLA of 99.99% for your application and database tiers and shows overall how it’s implemented using a combination of Azure Availability Zones and Veritas Alta Enterprise Resiliency.

**Data Flow Sequence**

1. In this example, the SAP user executes a request via SAP’s NetWeaver / S/4HANA Fiori interface, custom application interface, SAP GUI or others.
2. Azure high-speed express route gateway is used to connect securely from an on-premises network to Azure Virtual Machines and other Azure resources.
3. Web front end (SAP Web Dispatcher) is configured in a load balancer and it connects to the appropriate application server to handle the dialog work.
4. Request flows into the highly available SAP Central Services ASCS (ENQUEUE) and then through SAP application servers running on Azure Virtual Machines in an Azure VM. Availability zones offer a 99.95 percent uptime SLA.
5. Veritas Alta Enterprise Resiliency is configured across VMs under Availability Zones.
6. SAP Central Service Instance ASCS and Replication server are single points of failure that are monitored and controlled by Veritas Alta Enterprise Resiliency to achieve 99.99% SLA.
7. The user request flows into the highly available SAP ABAP SAP Central Services (ASCS), and then through SAP application servers running on Azure Virtual Machines. The request moves from the SAP app server to the database running on an AZ1 high-performance Azure VM.
9. The Veritas SAPNW agent monitors ASCS instance across AZ1 as active and ERS instance as standby.
10. The Veritas SAPNW agent monitors ERS instances across AZ2 as active and ASCS instance as standby.
11. The primary database is active on Availability Zone1 (AZ1) and secondary/standby on Availability Zone2 (AZ2) servers running on SAP certified virtual machines are clustered at the OS level for 99.99% availability using Veritas Alta Enterprise Resiliency. Database replication is handled by Flexible Storage sharing from primary to standby, achieving a zero Recovery Point Objective (RPO).

**Note:** In addition to configuring the database for HA, DR, or both, you need to ensure that the client applications (e.g., the S/4HANA / NetWeaver application server, JDBC, ODBC connection, and so on) can re-establish their connection with the database system after the failover. To do so, you can configure either network-based IP redirection or network-based DNS redirection of your database system. Veritas agents for SAP support end-to-end HA and DR for SAP NetWeaver and SAP S/4HANA.

**Common Dependency Between SAP S/4HANA and SAP HANA Databases**

The following graphic depicts the typical dependency between an SAP application and an SAP HANA database:

![Diagram showing the dependency between SAP application and SAP HANA database]

**Note:** FSS supports all Azure storage services. VxVM, VxFS, and FSS can be used with S/4HANA / SAP NetWeaver application servers as well as most database management systems, however these features are not currently supported for use with SAP HANA databases.
Cost Optimization OF SAP Instances in Azure for SAP NetWeaver / S/4HANA

Microsoft Azure lets you create and optimize SAP instances for development, testing, or production environments. If an SAP production application instance outage occurs, Veritas Alta Enterprise Resiliency fails over the instances between the designated SAP systems without disrupting the client connections. Thus, it reduces the overall Total Cost of Ownership (TCO) in case of a disruption or outage of SAP instances on Azure.

Supported use Cases for SAP NetWeaver / S/4HANA in Azure

Veritas Alta Enterprise Resiliency can monitor and control SAP NetWeaver / S/4HANA-based application instances in the following scenarios:

- SAP Application instances configured in Azure Availability set(local cluster)
- SAP Application Instances running across AZs (within the same Microsoft Azure region)
- Disaster Recovery between AZs across regions
- On-premises to Azure failover(DR)

SAP S/4HANA / Netweaver instances on Availability Set

Install and configure an SAP Central Service instance with a virtual host name and ensure that the virtual host name is resolvable from all of the other SAP instance hosts. In this use case enqueue server and enqueue replication server instances exist in the same AZ with availability set.

After you set the enqueuer or the replication parameter to TRUE (enque/server/replication = true), all the enqueue locks are replicated to the enqueue server and are available on the replication server. If the enqueue server instance fails or becomes unavailable, the SAPNW agent detects the fault and automatically triggers the failover of the enqueue server to the enqueue replication server node. Thus, the enqueue replication server is converted to the enqueue server. In this use case, two instances are configured with the SAP standalone enqueue server(ENQUEUE) and the SAP enqueue replication server (ERS).
**Note:** SAP Application data and sapmnt are mounted and managed with Veritas FSS/CFS, VxVM and VxF tools.

**Note:** The failover scenario works as per SAP high availability certification guidelines.

After the fault is cleared and the node is recovered, the enqueue replication server starts replicating back the enqueue locks from the enqueue server.

You can refer to the following link to learn more about availability set:
https://docs.microsoft.com/en-us/azure/virtual-machines/linux/tutorial-availability-sets

**SAP Application server instances across AZs in the same Microsoft Azure region**

In this configuration, the ASCS and the ERS instances are configured on different AZs in the same region. When ENQUEUE Replication is enabled between the two instances, all the enqueue locks are replicated to the ERS instance.

In this example, the ASCS and the ERS instances are configured in different AZs with local clustering.
If the ASCS(ENQUEUE) instance fails or becomes unavailable, the SAPNW agent identifies the fault and automatically triggers the failover operation on the ERS instance residing on Availability Zone 2. The following graphic depicts this action:

You may choose to clear the fault and perform any other necessary maintenance activities on the old ASCS instance. Thereafter, the SAPNW agent can automatically switch over the ERS instance to Availability Zone 1. ENQUEUE Replication can then continue in the reverse direction.

The following graphic illustrates this action:

SAP Application instances across Microsoft Azure regions

In this scenario, the SAP application production instances running in the primary site are configured in Availability Zone 1 and Availability Zone 2 respectively, in Region 1. The second set of Dev/QA SAP application instances runs on the DR site in Region 2. The SAP application data replication is managed by Veritas Volume Replicator (VVR) technology between Regions 1 and 2. The following graphic depicts this configuration:
If one of the primary instance fails, the SAPNW agent automatically triggers failover of the ASCS (ENQUEUE) resource from the AZ1 to the AZ2 ERS instance in the same region. The following graphic represents the use case:
If all the instances across an AZ or Region fail, the SAPNW agent automatically triggers the switchover action by failing over the ASCS resource from the primary site to the DR site instances in the remote region. The following graphic depicts how the DR site in the remote region becomes active using the Veritas Global Cluster Option (GCO) configuration:

![Diagram showing switchover process between two regions.]

Thereafter, you’ll need to clear the faults on the instances in Region 1, and then they can be used as the new Dev/QA systems. The following graphic shows the direction of the replication being reversed:

![Diagram showing replication in reverse between two regions.]

For details, refer to the Veritas agent installation and configuration documentation at: https://sort.veritas.com/agents/getting_started
On-Premises to Azure Failover (DR)

In this use case, all the SAP application instances are on-premises (primary site). Shared components like the sapmnt, trans, database data volumes and log volumes are configured with Veritas’ Clustered File System (CFS). VVR manages the replication of data across sites. On Azure (secondary site), the storage volumes are allocated from Azure storage and shared components are configured with FSS.

When a disaster occurs at the primary site, all the SAP application and database instances are migrated to Azure. This can be triggered automatically or done manually by bringing the SAP applications online in Azure, which then becomes the primary site. The AzureIP and AzureDNSzone agents manage the virtual IPs and virtual hostnames in the Azure environment.
Configuration Procedure

1. Configure a VPN to connect to the Microsoft Azure cloud. Follow the procedure as per the Azure documentation.

2. Create Azure instances based on the planning document and the sizing of instances recommended by Azure for SAP systems.

3. Install and configure Veritas InfoScale Enterprise on all of the servers in cluster. For details, refer to the Installation Guide.

4. Allocate SAP-recommended storage.

5. Prepare the cloud environment as follows:
   a) Create the Azure instances
   b) Allocate SAP-recommended storage
   c) Install and configure Veritas Alta Enterprise Resiliency solutions with valid licenses
   d) Configure Veritas Flexible Storage Sharing (FSS) and mount the following SAP mount points:
      - /sapmnt/
      - /usr/sap/<SID>/ASCSxx (xx implies the Instance Number 00-99)/
      - /usr/sap/<SID>/ERSxx/
      - /usr/sap/trans

   Note: FSS supports all Azure storage services. VxVM, VxFS, and FSS can be used with S/4HANA / SAP NetWeaver application servers as well as most database management systems, however these utilities are not currently supported for use with SAP HANA databases.

   For details, refer to the following InfoScale documentation:
   - Storage Foundation and High Availability Configuration and Upgrade Guide
   - Storage Foundation Cluster File System High Availability Administrator’s Guide
   - Storage Foundation Cluster File System High Availability Configuration and Upgrade Guide
   - Veritas InfoScale Disaster Recovery Implementation Guide

   For specific instructions, see the Storage Foundation Cluster File System High Availability Administrator’s Guide.

   Install and configure SAP NetWeaver / S/4HANA on the Microsoft Azure instances on primary and disaster recovery sites as per your disaster recovery plan.

   7. Configure Veritas Volume Replication between the sites in Azure and ensure that all of the required ports in Azure are enabled for replication.

   8. Configure InfoScale cluster service groups and resources for the SAP NetWeaver / S/4HANA instances. For details, refer to the following InfoScale documentation:
      - Storage Foundation and High Availability Configuration and Upgrade Guide
      - VCS sapnwb install guide: https://sort.veritas.com/agents/download_docs/19437/vcs_sapnw_install
Summary

Azure has emerged as one of the leading cloud providers for enterprise SAP deployments. Veritas Alta Enterprise Resiliency is a certified solution for providing high availability and disaster recovery for SAP S/4HANA and HANA databases in Azure. Veritas Alta Enterprise Resiliency’s direct integration with both SAP S/4HANA and Azure delivers visibility into all the components and processes that need to be managed as part of a highly available configuration for maximum application uptime. Some key benefits Veritas Alta Enterprise Resiliency provides for SAP S/4HANA:

- Automation of the entire failover process with integrated non-disruptive DR testing capability
- Near-instant fault detection that provides minimal RTO and RPO for S/4HANA applications and HANA databases
- Flexible configuration options that support multiple usage scenarios within the Azure cloud

With the ability to provide best-in-class architectural flexibility, availability, and resiliency for SAP S/4HANA and SAP HANA databases, Veritas Alta Enterprise Resiliency enables businesses to improve on SAP application SLA’s while reducing infrastructure footprints by integrating cloud into their IT strategy. When running your SAP S/4HANA applications and HANA databases in Azure, Veritas Alta Enterprise Resiliency is the leading SAP certified availability and resiliency solution that provides the tools needed to run SAP applications with maximum uptime.

About Veritas

Veritas Technologies is a leader in multi-cloud data management. Over 80,000 customers—including 95 percent of the Fortune 100—rely on Veritas to help ensure the protection, recoverability, and compliance of their data. Veritas has a reputation for reliability at scale, which delivers the resilience its customers need against the disruptions threatened by cyberattacks, like ransomware. No other vendor is able to match the ability of Veritas to execute, with support for 800+ data sources, 100+ operating systems, 1,400+ storage targets, and 60+ clouds through a single, unified approach. Powered by Cloud Scale Technology, Veritas is delivering today on its strategy for Autonomous Data Management that reduces operational overhead while delivering greater value.
