About This Guide

This document enumerates specific combinations of server operating systems, browsers and software that are compatible with and supported by the Veritas eDiscovery Platform. The following tables should eliminate ambiguity as to which components work together in the eDiscovery eco-system.

Key

The tables in this document use the following terminology:

Abbreviation	Description
CHF	Cumulative Hotfix
OR	Original Release.
SP	Service Pack.
Y	Use of the combination of products is supported.
N	Use of the combination of products is not supported.
P	Pending. Use of the combination of products is not currently supported. Following testing, this value will change to Y or N.

eDiscovery Platform and Veritas Global End of Life (EOL) Policy

The eDiscovery EOL Policy discusses what product versions are not supported. See <https://sort.veritas.com/eosl>.

August 6, 2017 is the End of Support Life (EOSL) for 7.XX versions of the eDiscovery platform. We do not provide support for all 8.XX versions and encourage users to upgrade to the current version of the platform.

Case backups created in V7.XX+ are still supported for restore in later versions.

The Veritas Global EOL policy is aligned with how Veritas product cycles are refreshed to ensure that our customers receive the maximum benefit of Veritas support without the need to raise support exception requests. See https://www.veritas.com/content/support/en_US/terms/support-fundamentals.html.

This file type is not directly supported by eDiscovery Platform. Users can extract the data from the Forensic Image file to disk and then process as a normal source.

Alternatively, mount the image using a tool such as Mount Image Pro or OSFMount and then process the data from this Mount Point (drive letter of folder) directly as a normal source folder. However, the data needs to remain available via the Mount Point for the entirety of the case including the review and export phase. This approach has not been tested at scale, so performance implications are unknown.

* This file type is supported as a normal source; eDiscovery Platform will process it automatically including the review and export phase. This approach has not been tested at scale, so performance implications are unknown.

** eDiscovery Platform can process the MDM file created by using an EnCase EnScript and a supported version of Encase (32-bit). User then needs to add the MDM file along with the E0x files as source to process.
