# **Feature Description**

Enterprise Vault 12 offers new features for intelligent archiving with the introduction of Classification and Retention Plans. Deploying these features will allow organizations to automatically classify any ingested content, whether it be from Exchange, Domino, Files, PSTs, NSFs, SharePoint or the Content Management API.

Administrators are able to define policies and rules that will classify items based on the content or metadata of the item being archived. The system is then able to make intelligent decisions on whether an item needs to be kept for certain period, discarded, included in the supervisory review in Compliance Accelerator, or have searchable tags added to aid end user or eDiscovery searches.

## **Business Value**

Automatic Classification of information can help organizations:

- make better **information retention decisions** by only keeping the information you need, or automatically deleting the information you definitely do not want to keep long term (news alerts, social media feeds, lunch menus, etc)
- make better eDiscovery decisions using searchable tags
- include items for supervisory review in Compliance Accelerator
- classify personally identifiable information (PII), and make better information protection decisions
- enable risk analysis and conduct any necessary remediation
- be compliant with industry regulations and avoid fines.

A large set of example rules ship with the product to aid customers in creating the initial set of classification rules, and includes identification of items such as: Social Security Number (US), Driving License (UK), VAT/TFA number (France), CPF number (Brazil), Identity Card (Germany), National Registry Identification Number (Singapore), Visa, MasterCard and American Express amongst others.

Enterprise Vault 12 also includes the ability to **re-classify** content in archives. This can potentially introduce storage savings by deleting unwanted items residing in older archives. Re-classification can also be used in cases where new regulations are introduced, or simply because the organization changed the policy and would like to retrospectively apply these changes to ensure they are compliant.

Additionally, Enterprise Vault 12 introduces a feature known as **Gated Deletion**. Gated Deletion forces any item manually deleted by end users or through automatic expiry to be presented to the classification rules first, to ensure the deletion action is compliant with the current policy. At this point the delete action can be denied, or the item's retention category automatically changed if for example it's found that the file was a contract that should be kept for a longer period.

# **Underlying Principles**

EV12 Classification is powered by the Veritas Information Classifier (VIC) engine, developed as a plug-in to the Windows Server File Classification Infrastructure (FCI). One of the benefits of using the Windows FCI platform is that customers with an existing FCI compatible engine configured (Websense, Titus, etc.) can use that instead to perform classification.

All the classification processes are performed locally on the Enterprise Vault Server. Figure 1 shows a high level overview of the components involved in the Classification process.

**Figure 1 – Overview of Classification Components** 

Firstly, the item is ingested via an agent (for example File System Archiving Task, SMTP, Exchange Mailbox Archiving Task), and then passed to storage service to perform the content conversion. At this point if the destination archive is enabled for Classification with a Retention Plan, the converted index version of the original item is passed to the StorageClassifier process, which in turn will pass the item to the Veritas Information Classifier engine.

The Classification rules will now be applied to the item, and any tags (custom, discard, include or exclude from supervisory review) will be passed back to the StorageRuntime process before the item is stored. At this point if a Classification tag matches a Retention Category, the retention category of the item will be updated (if allowed by policy).

All the Classification functionality available to items at the point of ingestion also applies to items passed to Classification by user delete or automatic expiry operations.

## **Guided Tour**

This section will provide a high level overview of how to configure Classification.

#### **Step 1: Configure Classification Policy**

The first step is to create and configure the Classification Policy. The policy will control how Classification is applied to items (Figure 2).

| Classification Policy Properties - Default Classification ×  |  |
|--|--|
| General Settings Advanced Targets  |  |
| Items can be classified for tagging and retention control. For tagging, items need to be classified during indexing.   |  |
| ✓ Classify items during indexing   |  |
| Classification can set the retention category of items during user deletion<br>and expiry (and during indexing, if you also check the option above). A<br>retention category set by classification overrides the retention plan<br>settings. |  |
| ✓ Set retention category of items  |  |
| When items are classified during user deletion or automatic expiry,<br>the retention category determined by classification may prevent<br>deletion or expiry from occurring.   |  |
| ✓ During user deletion   |  |
| ✓ During automatic expiry  |  |
|  |  |

|  |  |
| OK Cancel Apply Help   |  |

#### Figure 2 – Classification Policy Configuration

Once the Classification policy is configured, the Retention Plan can be created and associated with the archive you wish to enable for Classification.

#### Step 2: Configure Retention Plans and associate with an archive

Retention Plans encapsulate a Retention Category and a Classification Policy, as shown in Figure 3.

| Retention P                         | lan Properties - Exchange SMTP Journal                              |

|                                     |   |
|                                     |   |
|                                     |   |
|                                     |   |
|                                     |   |
|                                     | OK Cancel Apply Help  |

**Figure 3 – Retention Plan Properties** 

A Retention Plan will allow the administrator to specify a default Retention Category to apply to all items sent to that particular archive, and if no Classification rule matches or attempts to change the Retention Category for that item, the default Retention Category will be applied.

Classification is enabled on a per archive basis, using Retention Plans. Retention Plans are assigned to archives either through Provisioning Groups in the Vault Admin Console, or via a PowerShell command (Figure 4).

### Step 3: Enable Test Mode for Classification

Once the archive is enabled for Classification, a Classification tab will appear in the properties of the archive (Figure 5).

| A   | Archive Propertie  | es - SMTP Journa    | al X           |

|   | OK Can   | cel Apply           | Help           |

Figure 5 – Classification Test Mode

The Test Mode setting in Figure 5 is very useful for confirming that the configured Classification rules work as expected, before actually enabling the functionality on production data. Test mode will generate a report based on the rules configured, and does not require a Retention license. Figure 6 shows an example report.

## Figure 7 – Configuring Classification Rules

Figure 8 shows an example of the rule to detect Visa bank cards. The example rule will search for the card string across the whole item, and stamp a PII tag to the message or file, and optionally change the retention category of the item.

Figure 8 – Configuring Classification Rules

## Step 5: View or search on Classification tags

Enterprise Vault Search can be configured to display and search for specific Classification tags. Figure 9 shows the Classification tags displayed in an SMTP Journal archive.

## Licensing and support considerations

Retention Plans, Classification, Re-Classification & Gated Deletion are included in the Enterprise Vault Retention license. To try out classification in test mode, no license is required.

Enterprise Vault 12's Classification replaces Enterprise Vault Data Classification Services (DCS). DCS is still supported, and if required can be used in conjunction with Classification, but no new license sales will be accepted. To add additional user licenses to DCS, contact the Veritas Enterprise Vault Pricing & Licensing team.
